

Amendments to the Claims

1. (Currently Amended) A free flow electrophoresis microchip, comprising:
a separation chamber comprising a planar chamber having a planar region in
which charged components are in use separated;
a plurality of separation medium inlet channels having outlets fluidly
connected to one, inlet side of the separation chamber through which flows of a
separation medium are in use introduced into the separation chamber such as to
develop a laminar flow having a flow direction through the separation chamber;
a sample inlet channel having an outlet fluidly connected to the inlet side
of the separation chamber through which a flow of a sample containing charged
components is in use introduced into the separation chamber;
a plurality of outlet channels having inlets fluidly connected to another,
outlet side of the separation chamber opposite the inlet side thereof; and
a magnetic field unit for providing a magnetic field substantially orthogonal
to the planar region of the separation member and to the flow direction of the
separation medium;
whereby charged components introduced into the separation chamber are
deflected laterally across the separation chamber in dependence upon the
charge of the charged components.
2. (Original) The microchip of claim 1, wherein the outlets of the separation medium
inlet channels are disposed in spaced relation along the inlet side of the
separation chamber.
3. (Previously Presented) The microchip of claim 1, wherein the outlet of the sample
inlet channel is disposed in a central region of the inlet side of the separation
chamber.
4. (Previously Presented) The microchip of claim 1, wherein the outlet of the sample
inlet channel is disposed in an end region of the inlet side of the separation
chamber.

5. (Currently Amended) The microchip of claims 1, wherein the outlets of the sample inlet channel and the separation medium inlet channels face in the same direction.
6. (Previously Presented) The microchip of claim 1, wherein the separation medium inlet channels are commonly fluidly connected.
7. (Previously Presented) The microchip of claim 1, wherein groups of ones of the separation medium inlet channels are commonly fluidly connected.
8. (Previously Presented) The microchip of claim 1, wherein the separation medium inlet channels are separately fluidly connected.
9. (Previously Presented) The microchip of claim 1, wherein the outlets of the sample inlet channel and the separation medium inlet channels are disposed in opposed relation to the inlets of the outlet channels.
10. (Previously Presented) The microchip of claim 1, wherein the inlets of the outlet channels have a depth at least as great as that of the separation chamber.
11. (Previously Presented) The microchip of claim 1, wherein the inlets of the outlet channels are disposed in spaced relation along the outlet side of the separation chamber.
12. (Original) The microchip of claim 11, wherein the inlets of the outlet channels are equi-spaced.
13. (Cancelled)
14. (Cancelled)

15. (Currently Amended) The microchip of claim 13, wherein the separation chamber has a depth of from about 5 μm to about 50 μm .
16. (Previously Presented) The microchip of claim 1, wherein the magnetic field unit comprises at least one magnet.
17. (Original) The microchip of claim 16, wherein the at least one magnet comprises a layer of magnetic material.
18. (Original) The microchip of claim 17, wherein the magnetic material comprises a Ni-Fe permalloy.
19. (Previously Presented) The microchip of claim 1, further comprising:
first and second electrode units disposed at respective ones of other, lateral sides of the separation chamber.
20. (Original) The microchip of claim 19, wherein the electrode units each comprise an electrolyte reservoir disposed adjacent the respective lateral side of the separation chamber for containing a volume of an electrolyte medium, and a plurality of connection channels fluidly connecting the electrolyte reservoir to the respective lateral side of the separation chamber.
21. (Original) The microchip of claim 20, wherein each electrolyte reservoir has substantially the same length as the separation chamber.
22. (Previously Presented) The microchip of claim 20, wherein the connection channels are disposed in spaced relation along the respective lateral sides of the separation chamber.
23. (Original) The microchip of claim 22, wherein the connection channels are equi-spaced.

24. (Previously Presented) The microchip of claim 20, wherein the connection channels have a width of from about 1 μm to about 5 μm .
25. (Previously Presented) The microchip of claim 20, wherein the electrode units each further comprise an electrode element disposed in the respective electrolyte reservoir.
26. (Previously Presented) A free flow electrophoresis separation system, comprising:
the free flow electrophoresis microchip of claim 19; and
a high-voltage supply for applying an electric field between the electrode units and across the separation chamber in a direction substantially orthogonal to the magnetic field;
whereby a magnetohydrodynamic flow of sample and separation medium is induced through the separation chamber.
27. (Previously Presented) A free flow electrophoresis separation system, comprising:
the free flow electrophoresis microchip of claim 1; and
a supply unit for supplying flows of sample and separation medium through the respective ones of the sample inlet channel and the separation medium inlet channels and into the separation chamber;
whereby an electric field is induced across the separation chamber in a direction substantially orthogonal to the flow direction.
28. (Original) The system of claim 27, wherein the supply unit comprises a first transfer unit fluidly connected to the sample inlet channel for delivering a flow of sample through the sample inlet channel and into the separation chamber, and at least one second transfer unit fluidly connected to the separation medium inlet channels for delivering flows of separation medium through the separation medium inlet channels and into the separation chamber.

29. (Original) The system of claim 28, wherein at least one of the first transfer unit and the at least one second transfer unit are operable to control flow rates of the sample and separation medium flows to the separation chamber.
30. (Previously Presented) The system of claim 28, wherein the at least one second transfer unit comprises a plurality of second transfer units fluidly connected to respective ones of the separation medium inlet channels.
31. (Original) The system of claim 30, wherein the plurality of second transfer units are fluidly connected to groups of ones of the separation medium inlet channels.
32. (Original) The system of claim 30, wherein the plurality of second transfer units are fluidly connected to separate ones of the separation medium inlet channels.
33. (Previously Presented) The system of claim 28, wherein each transfer unit comprises a delivery pump.
34. (Previously Presented) The system of claim 26, further comprising:
 - at least one collection unit fluidly connected to at least one of the outlet channels for collection of at least one separated component.
35. (Original) The system of claim 34, comprising:
 - a plurality of collection units fluidly connected to respective ones of the outlet channels for collection of a plurality of separated components.
36. (Previously Presented) The system of claim 26, further comprising:
 - a detection unit for detecting migration of at least one separated component through at least one of the outlet channels.
37. (Original) The system of claim 36, wherein the detection unit is configured to detect migration of separated components through a plurality of ones of the outlet channels.

38. (Original) The system of claim 37, wherein the detection unit is configured to detect migration of separated components through each of the outlet channels.
39. (Currently Amended) A free flow electrophoresis method of separating charged components, the method comprising the steps of:
- providing a free flow electrophoresis microchip, comprising: a separation chamber comprising a planar chamber having a planar region in which charged components are separated;
 - a plurality of separation medium inlet channels having outlets fluidly connected to one, inlet side of the separation chamber; a sample inlet channel having an outlet fluidly connected to the inlet side of the separation chamber;
 - a plurality of outlet channels having inlets fluidly connected to another, outlet side of the separation chamber opposite the inlet side thereof;
 - a magnetic field unit for providing a magnetic field in a direction substantially orthogonal to the planar region of the separation member and to the flow direction of the separation medium; and
 - first and second electrode units disposed at respective ones of other, lateral sides of the separation chamber; and
 - applying a potential between the electrode units so as to generate an electric field across the separation chamber in a direction substantially orthogonal to the magnetic field direction, wherein the electric field acts together with the magnetic field to induce a magnetohydrodynamic flow of sample and separation medium through the separation chamber, and deflect the charged components laterally across the separation chamber in dependence upon the charge of the charged components.
40. (Original) The method of claim 39, wherein the outlets of the separation medium inlet channels are disposed in spaced relation along the inlet side of the separation chamber.

41. (Previously Presented) The method of claim 39, wherein the outlet of the sample inlet channel is disposed in a central region of the inlet side of the separation chamber.
42. (Previously Presented) The method of claim 39, wherein the outlet of the sample inlet channel is disposed in an end region of the inlet side of the separation chamber.
43. (Previously Presented) The method of claim 39, wherein the outlets of the sample inlet channel and the separation medium inlet channels face in the same direction.
44. (Previously Presented) The method of claim 39, further comprising the step of:
commonly introducing separation medium through the separation medium inlet channels.
45. (Previously Presented) The method of claim 39, further comprising the step of:
introducing different separation media through respective groups of ones of the separation medium inlet channels.
46. (Previously Presented) The method of claim 39, further comprising the step of:
introducing different separation media through respective ones of the separation medium inlet channels.
47. (Previously Presented) The method of claim 39, wherein the outlets of the sample inlet channel and the separation medium inlet channels are disposed in opposed relation to the inlets of the outlet channels.
48. (Previously Presented) The method of claim 39, wherein the inlets of the outlet channels have a depth at least as great as that of the separation chamber.

49. (Previously Presented) The method of claim 39, wherein the inlets of the outlet channels are disposed in spaced relation along the outlet side of the separation chamber.
50. (Original) The method of claim 49, wherein the inlets of the outlet channels are equi-spaced.
51. (Cancelled)
52. (Cancelled)
53. (Currently Amended) The method of claim ~~54~~39, wherein the separation chamber has a depth of from about 5 μm to about 50 μm .
54. (Previously Presented) The method of claim 39, wherein the magnetic field unit comprises at least one magnet.
55. (Original) The method of claim 54, wherein the at least one magnet comprises a layer of magnetic material.
56. (Original) The method of claim 55, wherein the magnetic material comprises a Ni-Fe permalloy.
57. (Previously Presented) The method of claim 39, wherein the electrode units each comprise an electrolyte reservoir disposed adjacent the respective lateral side of the separation chamber for containing a volume of an electrolyte medium, and a plurality of connection channels fluidly connecting the electrolyte reservoir to the respective lateral side of the separation chamber.
58. (Original) The method of claim 57, wherein each electrolyte reservoir has substantially the same length as the separation chamber.

59. (Previously Presented) The method of claim 57, wherein the connection channels are disposed in spaced relation along the respective lateral sides of the separation chamber.
60. (Original) The method of claim 59, wherein the connection channels are equi-spaced.
61. (Previously Presented) The method of claim 57, wherein the connection channels have a width of from about 1 μm to about 5 μm .
62. (Previously Presented) The method of claim 57, wherein the electrode units each further comprise an electrode element disposed in the respective electrolyte reservoir.
63. (Previously Presented) The method of claim 39, further comprising the step of:
collecting at least one separated component from at least one of the outlet channels.
64. (Original) The method of claim 63, wherein the step of collecting at least one separated component comprises the step of:
collecting separated components from respective ones of the outlet channels.
65. (Currently Amended) The method of claims 39, further comprising the step of:
detecting migration of at least one separated component through at least one of the outlet channels.
66. (Original) The method of claim 65, wherein the step of detecting migration of at least one separated component comprises the step of:
detecting migration of separated components through a plurality of ones of the outlet channels.

67. (Original) The method of claim 66, wherein the step of detecting migration of at least one separated component comprises the step of:
detecting migration of separated components through each of the outlet channels.
68. (Currently Amended) A free flow electrophoresis method of separating charged components, the method comprising the steps of:
providing a free flow electrophoresis microchip, comprising: a separation chamber comprising a planar chamber having a planar region in which charged components are separated;
a plurality of separation medium inlet channels having outlets fluidly connected to one, inlet side of the separation chamber;
a sample inlet channel having an outlet fluidly connected to the inlet side of the separation chamber;
a plurality of outlet channels having inlets fluidly connected to another, outlet side of the separation chamber opposite the inlet side thereof; and
a magnetic field unit for providing a magnetic field in a direction substantially orthogonal to the planar region of the separation member and to the flow direction of the separation medium; and
supplying flows of sample and separation medium through the respective ones of the sample inlet channel and the separation medium inlet channels into and through the separation chamber, wherein the flow of separation medium acts together with the magnetic field to induce an electric field across the separation chamber in a direction substantially orthogonal to the flow direction, which electric field acts to deflect the charged components laterally across the separation chamber in dependence upon the charge of the charged components.
69. (Original) The method of claim 68, wherein the outlets of the separation medium inlet channels are disposed in spaced relation along the inlet side of the separation chamber.

70. (Previously Presented) The method of claim 68, wherein the outlet of the sample inlet channel is disposed in a central region of the inlet side of the separation chamber.
71. (Previously Presented) The method of claim 68, wherein the outlet of the sample inlet channel is disposed in an end region of the inlet side of the separation chamber.
72. (Currently Amended) The method of claims 68, wherein the outlets of the sample inlet channel and the separation medium inlet channels face in the same direction.
73. (Previously Presented) The method of claim 68, wherein the step of supplying sample and separation medium includes the step of:
commonly supplying separation medium through the separation medium inlet channels.
74. (Previously Presented) The method of claim 68, wherein the step of supplying sample and separation medium includes the step of:
supplying different separation media through respective groups of ones of the separation medium inlet channels.
75. (Previously Presented) The method of claim 68, wherein the step of supplying sample and separation medium includes the step of:
supplying different separation media through respective ones of the separation medium inlet channels.
76. (Previously Presented) The method of claim 68, wherein the step of supplying sample and separation medium comprises the step of:
delivering sample and separation medium flows through the respective ones of the sample inlet channel and the separation medium inlet channels and into the separation chamber.

- 77. (Previously Presented) The method of claim 68, wherein flow rates of the sample and separation medium flows are regulated to control the lateral deflection of the charged components.
- 78. (Previously Presented) The method of claim 68, wherein the outlets of the sample inlet channel and the separation medium inlet channels are disposed in opposed relation to the inlets of the outlet channels.
- 79. (Previously Presented) The method of claim 68, wherein the inlets of the outlet channels have a depth at least as great as that of the separation chamber.
- 80. (Previously Presented) The method of claim 68, wherein the inlets of the outlet channels are disposed in spaced relation along the outlet side of the separation chamber.
- 81. (Original) The method of claim 80, wherein the inlets of the outlet channels are equi-spaced.
- 82. (Cancelled)
- 83. (Cancelled)
- 84. (Currently Amended) The method of claim ~~82~~68, wherein the separation chamber has a depth of from about 5 μm to about 50 μm .
- 85. (Previously Presented) The method of claim 68, wherein the magnetic field unit comprises at least one magnet.
- 86. (Original) The method of claim 85, wherein the at least one magnet comprises a layer of magnetic material.

87. (Original) The method of claim 86, wherein the magnetic material comprises a Ni-Fe permalloy.
88. (Previously Presented) The method of claim 68, wherein the microchip further comprises:
first and second electrode units disposed at respective ones of other, lateral sides of the separation chamber.
89. (Original) The method of claim 88, wherein the electrode units each comprise an electrolyte reservoir disposed adjacent the respective lateral side of the separation chamber for containing a volume of an electrolyte medium, and a plurality of connection channels fluidly connecting the electrolyte reservoir to the respective lateral side of the separation chamber.
90. (Original) The method of claim 89, wherein each electrolyte reservoir has substantially the same length as the separation chamber.
91. (Previously Presented) The method of claim 89, wherein the connection channels are disposed in spaced relation along the respective lateral sides of the separation chamber.
92. (Original) The method of claim 91, wherein the connection channels are equi-spaced.
93. (Previously Presented) The method of claim 89, wherein the connection channels have a width of from about 1 μm to about 5 μm .
94. (Previously Presented) The method of claim 89, wherein the electrode units each further comprise an electrode element disposed in the respective electrolyte reservoir.

95. (Previously Presented) The method of claim 68, further comprising the step of:
collecting at least one separated component from at least one of the outlet channels.
96. (Original) The method of claim 95, wherein the step of collecting at least one separated component comprises the step of:
collecting separated components from respective ones of the outlet channels.
97. (Previously Presented) The method of claim 68, further comprising the step of:
detecting migration of at least one separated component through at least one of the outlet channels.
98. (Original) The method of claim 97, wherein the step of detecting migration of at least one separated component comprises the step of:
detecting migration of separated components through a plurality of ones of the outlet channels.
99. (Original) The method of claim 98, wherein the step of detecting migration of at least one separated component comprises the step of:
detecting migration of separated components through each of the outlet channels.
